

HANEESH PORTFOLIO

Full Management & Maintenance Guide

Created: June 2026

1. Your Project Location & URLs

Your project files are stored locally on your machine at the path below. You can edit, test, and publish updates directly from this folder.

```
Project Directory:  C:\Users\2025\Documents\haneesh portfolio\  
Live Site URL:      https://haneesh7.github.io/haneesh-portfolio/  
GitHub Repository: https://github.com/haneesh7/haneesh-portfolio
```

2. Running on Your PC (Local Development)

Start the local server:

To test changes instantly on your computer before publishing them online, run the development server:

- Open your terminal or command prompt.
- Navigate to your project directory and start the Vite development server using these commands:

```
cd "C:\Users\2025\Documents\haneesh portfolio"  
cmd /c npm run dev
```

- Open your browser and navigate to: <http://localhost:5173/> (or the address shown in your terminal).

Stop the local server:

Press Ctrl + C in the terminal window. When prompted with "Terminate batch job (Y/N)?", type Y and hit Enter.

Restart after computer restart:

Simply re-open your terminal, navigate back to your portfolio folder, and run "npm run dev" again.

3. Adding a New Project

Follow these steps to add a new project card to your portfolio:

- Step 1: Save your project image or screenshot in the public images directory:

```
C:\Users\2025\Documents\haneesh portfolio\public\images\your_project_name.png
```

- Step 2: Open "src\components\Work.tsx" in your code editor.
 - Step 3: Scroll to the projects array (around line 56). Add a new project object at the end of the array, using the `import.meta.env.BASE_URL` prefix for the image path:
-

```
{
  num: "04",
  name: "Deep Learning Project",
  category: "Computer Vision",
  tools: "Python, PyTorch, YOLOv9",
  image: import.meta.env.BASE_URL + "images/your_project_name.png"
},
```

- Step 4: Save the file. The browser running on <http://localhost:5173/> will automatically update so you can check your work.

4. Removing a Project

To remove any project from the Work section:

- Open "src\components\Work.tsx" in your editor.
- Locate the project object you want to remove inside the list.
- Delete the entire block (from the opening curly brace { to the closing curly brace }, including the comma).
- Save the file.

5. Editing Your Career / Experience Section

To edit details about your education, experience, or certifications:

- Open "src\components\Career.tsx" in your editor.
- Each entry is contained inside a `<div className="career-info-box">` block.
- To add an entry, copy an existing career-info-box block, paste it, and edit the header fields: `<h4>` for the role, `<h5>` for the school/employer, `<h3>` for the duration, and `<p>` for description points.
- Save the file.

6. Publishing Changes Live to GitHub Pages

Whenever you are happy with the changes on <http://localhost:5173/> and want to update your live website on GitHub, run these commands in your terminal:

```
cd "C:\Users\2025\Documents\haneesh portfolio"
"C:\Program Files\Git\bin\git.exe" add .
"C:\Program Files\Git\bin\git.exe" commit -m "Add new project and update career section"
"C:\Program Files\Git\bin\git.exe" push origin master
```

Once pushed, GitHub Actions will automatically start building and deploying your website. The process takes about 2 minutes.

7. Checking Build Status & Taking the Site Offline

Verify build status:

Go to <https://github.com/haneesh7/haneesh-portfolio/actions>. You will see a list of recent deployment workflows. A green checkmark means the site deployed successfully.

Taking the site offline (Temporarily):

Go to Repository Settings -> Pages. Under "Build and deployment" -> "Source", change the source branch to "None" or delete the deployment. To go live again, restore the source branch to "master".

Deleting the repository (Permanently):

Go to Settings, scroll down to the "Danger Zone", click "Delete this repository", and follow the prompts. Note: This action is irreversible.
